

Coyotes

And foxes

Coyotes

The coyote is a wild canine within the genus *Canis* related to wolves, dogs, and jackals. Coyotes are larger than foxes. They have non-retractable claws for hunting. Coyotes prefer hunting larger prey, e.g., deer and rabbits. Coyotes, while intelligent, are not as clever as foxes.

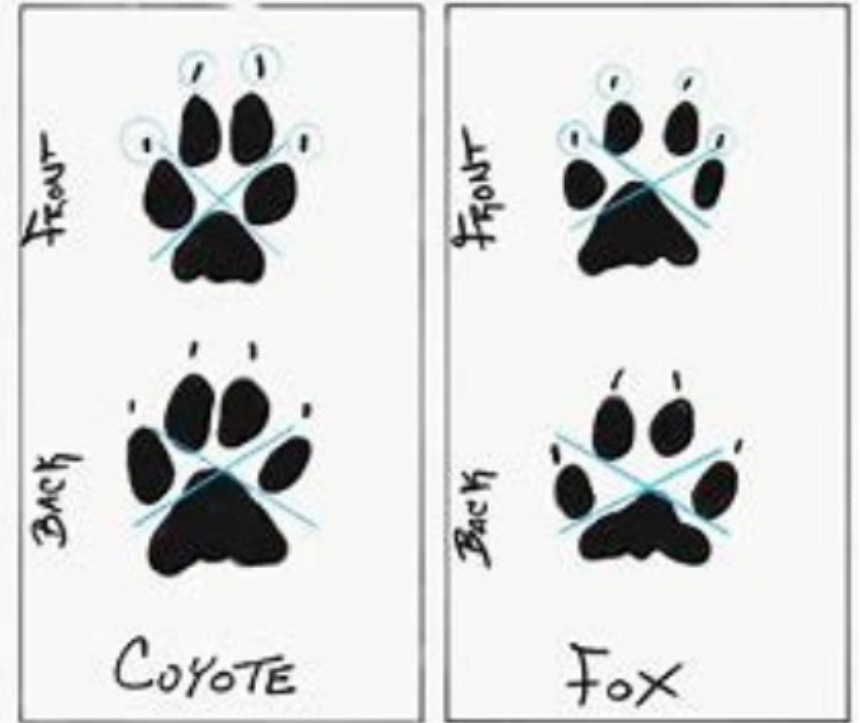

Foxes

Vulpes is a genus of the Canidae colloquially referred to as true foxes, however animals in other genera may have “fox” names. Foxes are shorter and smaller than coyotes. They also have non-retractable claws for hunting. Foxes are opportunistic predators, eating a variety of prey including mammals, birds and insects. Foxes have strong problem-solving skills.

Canines to *Clementine*

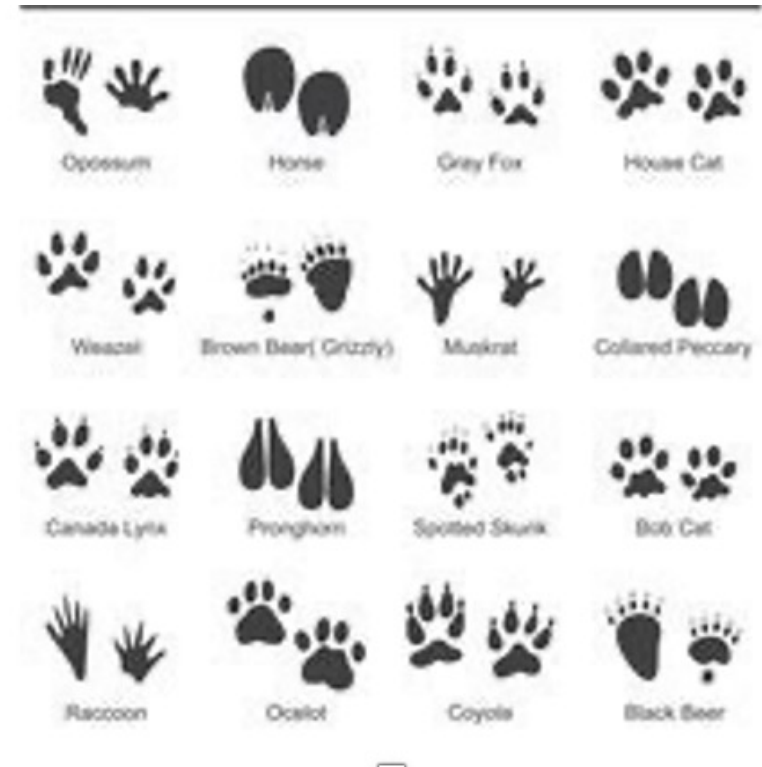

We are canines predatory, and
we're hunting for our prey,
Claws retracting, mainly nocturnal,
Coyotes sometimes out in day.
