© William L. Newton / CLO

A small duck of shallow ponds, the Blue-winged Teal breeds across much of the central and northern United States and Canada. Rather dull in plumage overall, it reveals its powder-blue wing patch in flight.

Green Winged Teal

A very small, brightly patterned duck, the Green-winged Teal prefers shallow ponds with lots of emergent vegetation. Along the coast, it prefers tidal creeks, mudflats, and marshes to more open water.

American Widgeon

A common and increasingly abundant duck, the American Wigeon breeds in northwestern North America and is found throughout the rest of the continent in migration and in winter. Its small bill and the male's white forehead, as well as certain aspects of nesting and feeding behavior, distinguish this species from other dabbling ducks.

T E X A S

Wood Duck

A colorful duck of wooded swamps and streamsides, the Wood Duck is one of only a few North American ducks that nest in trees. Many people consider it to be the most beautiful of all waterfowl.

Black-bellied Whistling Duck

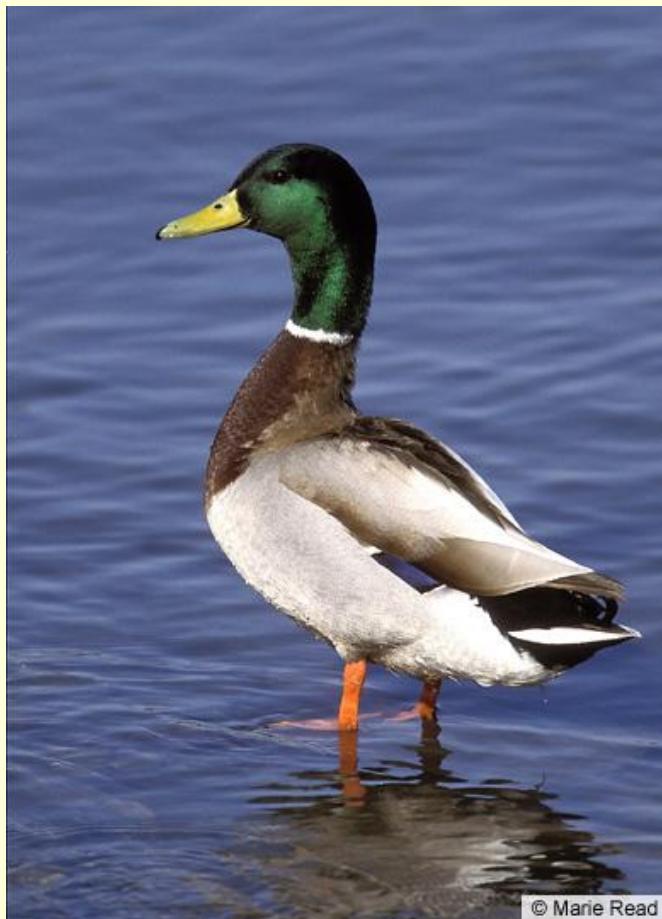

A striking and gregarious duck of the Neotropics, the Black-bellied Whistling-Duck reaches the United States only in the very southern parts. Its long neck, long legs, black belly, and white wing patch make it a distinctive-looking waterfowl.

Redhead Duck

An aptly named diving duck, the Redhead can be easily identified by its bright red head and gray back. Many female Redheads make no nests of their own, but instead lay their eggs in the nests of other ducks.

Mallard Duck

© Christopher Crowley/CLO

One of the most familiar of ducks, the Mallard is found throughout North America and all across Eurasia. Where it does not occur naturally, it often has been introduced. It is found in all kinds of wetlands and is a familiar inhabitant of urban park ponds.

American Coot

Often mistaken for a duck, the American Coot is a common waterbird. Its all black body and white chicken-like beak distinguish this swimming rail from the real ducks.

Canada Goose

© B. L. Sullivan

The most familiar and widespread goose in North America, the Canada Goose can be found in all kinds of water all across the continent, from the tundra to the Gulf Coast. Some populations have become resident in urban areas, and are now coming into conflict with people.

Snow Goose

© Mary Tremaine / CLO

A medium-sized goose that breeds on the arctic tundra, the Snow Goose travels south in very large, high-flying, noisy flocks. The swirling white of a descending flock suggests snow, but among the white birds are darker individuals. Until recently, the Blue Geese, as the dark birds were called, were considered a separate species. They are now recognized as merely a dark form (or "morph") of the Snow Goose.
